Some procedures most commonly performed in the ambulatory setting have relatively high risks for VTE. Examples of estimated risks include:

For aesthetic procedures:
- Abdominoplasty - 2%<sup>3</sup>
- Body contouring - 9.3%<sup>4</sup>
- Face lifts - 0.49%<sup>4</sup>
- High volume liposuction - 1.1%<sup>5</sup>

For otolaryngology procedures the risk is 1.3%.<sup>6</sup>

For a Caprini score (see Caprini Thrombosis Risk Assessment Tool) over 8, the incidence increases to 18.3%.<sup>7</sup>

**PRE-PROCEDURE SCREENING**

- Screening for risk of VTE has been shown to have a high positive predictive value.9
- There are published recommendations on screening and chemoprophylaxis; however, there are documented gaps in care because of concern with bleeding risk and perceived lack of awareness of these published recommendations.3, 10, 11 National health care organizations have issued several guidelines regarding VTE over the last decade.3, 12, 13, 14, 15, 16, 17, 18

**Add 2 points for each of the following statements that apply:**

- ____ Tube in blood vessel in neck or chest that delivers blood or medicine directly to heart within the last month (also called central venous access, PICC line, or port)
- ____ Confined to a bed for 72 hours or more
- ____ Age 61–74 years
- ____ Current or past malignancies (excluding skin cancer, but not melanoma)
- ____ Planned major surgery lasting longer than 45 minutes (including laparoscopic and arthroscopic)
- ____ Non-removable plaster cast or mold that has kept you from moving your leg within the last month

**Add 3 points for each of the following statements that apply:**

- ____ History of unexplained stillbirth infant, recurrent spontaneous abortion (more than 3), premature birth with toxemia or growth restricted infant
- ____ Elective hip or knee joint replacement surgery
- ____ Broken hip, pelvis or leg
- ____ Serious trauma e.g., multiple broken bones due to a fall or car accident
- ____ Spinal cord injury resulting in paralysis
- ____ Experienced a stroke

**For women only: Add 1 point for each of the following statements that apply:**

- ____ Current use of birth control or Hormone Replacement Therapy (HRT)
- ____ Pregnant or had a baby within the last month

**Add 5 points for each of the following statements that apply now or within the past month:**

| ____ History of unexplained stillbirth infant, recurrent spontaneous abortion (more than 3), premature birth with toxemia or growth restricted infant |
| ____ Elective hip or knee joint replacement surgery |
| ____ Broken hip, pelvis or leg |
| ____ Serious trauma e.g., multiple broken bones due to a fall or car accident |

**Score Risk Level**

- 0-2 Low
- 3-8 Increasing
- >8 18.3%

**PREVENTION**

- **Positioning** - Flex the patient’s knees to approximately five degrees by placing a pillow underneath them.2 11
- **Compression** - Elastic stockings or intermittent pneumatic compression devices (IPCs). Surgeons should be aware that many offices now have intermittent compression machines, having purchased them new or used, leased them, or rented them on a case-by-case basis.24 IPCs placed and operational before the induction of anesthesia (especially for lengthy procedures or those performed under general anesthesia) may decrease the DVT risk of procedures performed by 28%-23
- **Discontinue supplement hormones one week prior to the procedure.2**
- **Chemoprophylaxis** - Anticoagulants such as low-molecular-weight heparins (LMWH) given two hours before surgery, have been shown to protect patients throughout the peri-operative period. The risks of DVT must always be weighed against the risk of increased bleeding in any given patient. Prophylaxis should be provided for 7-10 days, or at least until resumption of normal ambulation, because the median time-to-event has been reported as 8 days.28, 30
- **Anesthesia** - Immobility associated with general anesthesia may be a significant risk factor for VTE. Intravenous sedation including propofol can allow surgeons to perform lengthy surgeries without general anesthesia.
- **Stage multiple procedures** - The length of the procedure itself increases the risk for many complications including VTE.
- **Early ambulation** - This should occur at the facility and be a part of post-discharge instructions.

**SIGNS, SYMPTOMS, AND MANAGEMENT**

- **DVT signs** include warmth, tenderness, and swelling. PE is associated with difficulty breathing and chest pain.27 Physicians should be suspect VTE when patients exhibit these symptoms and have recently had any surgery.
- **These can be life threatening situations; rapid diagnosis and treatment is very important.**
- **Suspicions should lead to immediate testing. The test recommended to confirm DVT is ultrasound with Doppler.26 Chest x-rays are recommended to confirm PE.29**
- **Treatment** - DVT may be treated with thrombolytics in the outpatient; however this requires careful patient selection and there are a number of factors that may lead to inpatient treatment options.20
